

Reflection:

The Lo-fidelity prototype was a quick iteration on ideas for what a shopping cart could look like. I think what was most important was the idea that the shopping cart was just one part of the larger process to check-out and purchase items. Thus, I thought it would be useful to put a timeline or progress bar along the top to show the user where they were and what was next in line to purchase their items. I also thought the ability to change the options, such as size and color, on the cart page, was important for ease of use and use flexibility, thus were included in both the lo-fi and mid-fi prototype. The final hi-fi mockup still needs to be modified to include interaction on those pieces, but it has all the essential elements for it.

A few changes were made to the mockup, largely to fix spacing and organizational issues. Title was moved into the navigation bar to maintain consistency. Many parts were moved into flex display or rearranged with flex to accommodate flexible sizing and displays. Many images were changed to fit a div with a different filling option to try to maintain aspect ratios of the original photos.

This additional page and starting of interactivity was wildly challenging but it is extremely rewarding to see the work start to come together into some cohesive piece of code that looks decent and functions as intended.
